vikaslraut.github.io

Software engineer with 8+ years of experience building enterprise web apps in Angular, React and TypeScript. Designed frontend platforms from scratch, led and mentored small teams, and was the sole frontend engineer on a multi-tenant compliance product for about a year. Outside work, built SocDocLoc, a not-for-profit platform now used by housing societies, and a local LLM assistant that answers through SQL tools, checked with evals.

SKILLS

Frontend: Angular (signals, standalone APIs), React, TypeScript, RxJS, NgRx, HTML, CSS, SCSS, Tailwind

UI and data: design tokens, AG Grid Enterprise, ECharts, D3, Angular Material, ng-zorro, accessibility (WCAG)

Engineering practice: Nx monorepos, Jest, Vitest, Playwright, Cypress, CI/CD, code reviews, mentoring

AI and LLM: tool calling, agent loops, keyword and vector search (pgvector), evals, local models (Ollama)

AI-assisted development: Claude Code with a spec-first, test-first workflow, MCP

Working knowledge: Node.js, NestJS, PostgreSQL, Prisma, ASP.NET Core, AWS, Docker

EXPERIENCE

Caizin, Pune | Senior Software Engineer III — Sep 2021 to Present

Lending platform modernisation — Aug 2026 to Present

Frontend Architect | US asset-finance software company

- **Terminal to web.** Set up the Angular frontend replacing a legacy terminal app for finance operators, with lint, type checks, layer rules, test coverage and bundle size limits on every change. Only frontend engineer on a 4-person track in a 16 to 20 person programme.
- **API-independent design.** Built the app to run on mock data behind the same interface the real API will use, so screens and tests move ahead while the backend contract is still being decided.
- **Accessibility analysis.** For a proposal, analysed 26 WCAG defects and 22 open fixes on another of the client's products, flagged fixes that would add screen reader and keyboard issues, and estimated the effort.

Cyber compliance platform | Frontend Owner | US enterprise compliance company — Jan 2024 to Aug 2026

- **End-to-end ownership.** Owned the frontend of a multi-tenant compliance portal used by broker-dealer firms (Angular, NgRx, AG Grid, 21 feature areas). Ran it alone for about a year after the team shrank from four to one, making the technical calls and handling releases.
- **Deputy frontend lead.** Set coding practices for the in-house and vendor teams on the project and enforced them through code reviews.
- **Modernisation.** Upgraded Angular 16 to 17, started moving features to standalone components and using signals in new code, without pausing feature work.
- **Login and sessions.** Owned login and session handling: Cognito sign-in with MFA and password reset, token refresh, logout and refresh kept in sync across browser tabs, idle timeout and admin impersonation.
- **Data-heavy views.** Built large server-side AG Grid compliance views whose columns change per customer, linked to embedded QuickSight dashboards.

Device validation app | Plain JavaScript app within the same cyber compliance platform — 2026

- **Legacy shutdown.** Merged three old device-check entry flows into one page to let the client retire a legacy system, and fixed mobile deep-link bugs on iOS and Android.

4E, enterprise KPI and performance platform | Frontend Architect and Lead | First lead role — 2021 to 2023

- **Built from scratch.** Set up the frontend as an Nx monorepo with shared libraries and lazy-loaded feature areas, and led and mentored a team of four.

- **Widget framework.** Designed a dashboard widget framework: users add, drag and resize widgets, and each user's layout is saved. Widgets load from a registry at runtime, so the team added 18 widget types without touching the framework.
- **Form and formula builders.** Built a no-code form builder with 15 field types, where number fields feed KPI calculations, and a drag-and-drop formula builder for metrics.
- **Platform and standards.** Built the shared pieces every screen used (sign-in with JWT and Azure AD, permission-based routes, light and dark themes on design tokens, HTTP caching) and set the team's coding standards, pre-commit checks and onboarding docs.
- **On-site go-live.** Went on site for a steel manufacturer's go-live, fixing issues quickly and testing beta releases with their users.

SNAP | Drug price transparency SaaS for pharma companies 2023

- Built Angular screens in an Nx monorepo, including a calendar task widget and data management pages.

C-DAC Hyderabad | Project Engineer — Jul 2018 to Aug 2021

- **Mobile device security.** Built the admin dashboard and REST API for a mobile device security product: app data collection, scheduled background jobs and status reports.
- **Live device control.** Built a device management console using Socket.IO for remote wipe, lock and upgrade, and a log analysis app for a cloud security project.
- **Blockchain apps.** Built web apps for property records and proof of existence for educational documents, with bulk blockchain transactions and PDF receipts, and packaged demos with Docker.

PERSONAL WORK

SocDocLoc | socdocloc.com | Not-for-profit compliance platform for housing societies | Live 2026

- **Product and platform.** Digital statutory registers for co-operative housing societies (share, nomination, meeting and property), with member verification, auditor review and print-ready PDFs, on a full-stack platform (React, TypeScript, ASP.NET Core, PostgreSQL) on AWS with a separate database per society.
- **Spec to production in 8 weeks.** Live with 2 housing societies (120 flats); both got a Class A audit grade.
- **Test-first AI workflow.** After earlier trials, built with Claude Code in strict steps: tests written first from acceptance criteria and locked, then code, then a fresh-session review. Shared it in an internal tech talk.

Ask Ledgr | Plain-language questions and entries for a personal finance app | Live pilot 2026

- **Local LLM assistant.** LLM assistant on a small open model running locally (Qwen3 4B with Ollama). It answers through six read-only tools that run SQL, so the model never does the maths, and it can only suggest new entries, which the user confirms.
- **Hybrid search.** Keyword and vector search (Postgres and pgvector) over free-text notes, with answers streamed to the Flutter app.
- **Measured with evals.** Accuracy rose from 6 of 10 to 13 of 14 on a fixed question set, mostly from redesigning the tools; a bigger 8B model scored worse (8 of 14).

Also built: Campus360, campus operations software piloting at 2 residential schools; Flyer, an online exam engine for coaching institutes (pre-launch); Order, QR table ordering for cafes.

TALKS AND RECOGNITION

- Talk: "Claude Code, Spec-Driven Development, and the SocDocLoc Story", internal tech talk at Caizin
- Caizin Above & Beyond award, twice: for business-critical delivery on the cyber compliance project, and for on-site support during a client go-live

EDUCATION

B.E. in Information Technology, Pune Institute of Computer Technology (PICT), 2016

Diploma in Computer Technology, Sinhgad's Sou Venutai Chavan Polytechnic, Pune, 2013
